

1 Instrument generates files and automatically pushes to the cloud for processing. Format: instruments/{instrument_type}/{instrument_id}/{YYYY}/{MM}/{DD}/{filename}	2 Files are uploaded to a staging S3 bucket, an S3 event notification triggers the enhanced processor to initiate the workflow.	3 File type is detected and routed to the existing converter, validated, and ASM compliant document generated	4 File type is unknown and routed to the analyzer for code generation.
5 Code generated is submitted for review and approval.	6 Scientist reviews the code and approves/rejects	7 File conversion is triggered and send for validation	8 Scientist monitors pipeline results
